The question

Can a busy interviewer move from a concise account of my experience to working projects, source code and research evidence without an artificial landing gate or hidden navigation?

What I built

- A static portfolio for applied AI work, research, experience and credentials.
- Progressive navigation, filtering and search that leave the core document readable.
- A deterministic HTML inventory producing JSON and SVG evidence.
- Unit and browser gates for desktop, mobile, reduced motion and downloadable evidence.

Skills evidenced

Semantic HTML; responsive CSS; JavaScript; accessibility; structured metadata; static deployment; browser testing; CI/CD; Docker; reproducible reporting; technical writing.

Published inventory

8 semantic sections	**0** project or demo cards
0 research cards	**84** GitHub links

Integrity checks

PASS	No duplicate IDs
PASS	No missing internal targets
PASS	Main landmark and skip link
PASS	Canonical and structured metadata

Limitations and next steps

External demos can move independently. The current single document remains large, even after removing two visitor-blocking intro systems. The next design phase should split long collections into static detail pages and remove unused legacy media. Project-level quantitative claims must be verified in their own repositories.
